(c) Hamid Sarbazi-Azad

Computer Structure &amp; Language, Lecture #7: Sample programs

2

Example 1: Write a program to add two 10-byte integers. Translate your program to machine code.

Address	Machine Code	Source Code
		----- dataset segment
0000	????????????????	int1: db 10 dup (?)
000A	????????????????	int2: db 10 dup (?)
0014	????????????????	sum: db 10 dup (?)
001E		----- dataset ends
		----- codeseg segment
0000		assume cs: codeseg, ds: dataset;
0000	B8???? = 10111000 ???...	start: mov ax, dataset
0003	8ED8 = 10001110 11011000	mov ds, ax
0005	BB0000 = 10111011 000...000	mov bx, 0
0008	B90A00 = 10111001 00001010 0000 0000	mov cx, 10
000B	F8 = 11111000	clc
000C	8A4700 = 10001010 01000111 0000 0000	mov al, int1[bx]
000F	12470A = 00010010 01000111 0000 1010	adc al, int2[bx]
0012	884714 = 10001000 01000111 0001 0100	mov sum[bx], al
0015	43 = 01000011	inc bx
0016	E2F4 = 11101111 11110100	loop addnext
0018	B8004C = 10111000 0000 0000 0100 1100	mov ax, 4c00h
001B	CD21 = 11001101 0010 0001	int 21h
001D		----- codeseg ends
		end start

2

(c) Hamid Sarbazi-Azad
Computer Structure & Language, Lecture #7: Sample programs
3

Example 2: Write a program to (gnome) sort an array of 100 words. Use one segment only.

```

myseg    segment
        assume cs: myseg, ds: myseg;
        dw      8000h
array:   dw      100 dup (?)

start:   mov     ax,cs      ; initialize DS
        mov     ds,ax
        mov     bx,0

next:    mov     ax,array[bx]
        cmp     ax,array+2[bx]
        jle     continue   == jnh
        xchg    ax,array+2[bx]
        mov     array[bx],ax
        sub     bx,4

continue:
        add     bx,2
        cmp     bx,198
        jl      next

        mov     ax,4c00h    ; return to OS
        int     21h

myseg    ends
        end      start
    
```

3

(c) Hamid Sarbazi-Azad
Computer Structure & Language, Lecture #7: Sample programs
4

Example 3: Write a program to add two 10x10 matrices using intra-segment procedure call.

```

dseg     segment
A:        dw      10 dup (10 dup (?))
B:        dw      10 dup (10 dup (?))
C:        dw      10 dup (10 dup (?))
dseg     ends

sseg     segment
words:   dw      100 dup(?)
sseg     ends

cseg     segment
        assume cs:cseg,ds:dseg,ss:sseg;

addmat   proc    near
        push    bp      ;
        push    cx      ; save
        push    bx      ; used
        push    ax      ; registers
        push    si      ;
        push    di      ;

        mov     bp,sp
        mov     cx,word ptr [bp+14] ; N
        mov     si, word ptr [bp+16] ; A
        mov     bx, word ptr [bp+18] ; B
        mov     di, word ptr [bp+20] ; C

        adder:  mov     ax,word ptr [si]
                add     ax,word ptr [bx]
                mov     word ptr [di], ax
                add     si,2
                add     di,2
                add     bx,2
                loop    adder

        pop     di
        pop     si
        pop     ax
        pop     bx
        pop     cx
        pop     bp

        ret     8

addmat   endp
    
```

4

(c) Hamid Sarbazi-Azad
Computer Structure & Language, Lecture #7: Sample programs
5

Example 3: Write a program to add two 10x10 matrices using procedure external. (cont.)

```

start:  mov     ax,dseg ; == mov ax, seg B
        mov     ds,ax
        mov     ax,sseg
        mov     ss,ax
        lea     sp,words+200 ; == mov sp, offset words+200
        mov     ax, offset C
        push    ax
        mov     ax, offset B
        push    ax
        mov     ax, offset A
        push    ax
        mov     ax, 100
        push    ax

        call    near ptr addmat

        mov     ax,4c00h ; return to OS
        int     21h

cseg    ends

        end     start
    
```

5

Computer Structure & Language, Lecture #7: Sample programs
6

## Macro Instruction definition

```

%*DEFINE (Macro name (parameter list))
(
    .....
    prototype code
    .....
)
    
```

Example:

```

%*define (pushr (a,b,c))
(
    push a
    push b
    push c
)

%*define (popr (a,b,c))
(
    pop a
    pop b
    pop c
)
    
```

Then we can use it as

```

%pushr (si,bx,cx)
%popr (bp,dx,ax)
    
```

That generate the following lines

```

push si
push bx
push cx

pop bp
pop dx
pop ax
    
```

6

(c) Hamid Sarbazi-Azad
Computer Structure & Language, Lecture #7: Sample programs
7

Example 4: Write a program for mirroring a string using inter-segment procedure call.

```

seg1      segment
str1:     dw      100 dup (?)
str2:     dw      100 dup (?)
seg1      ends

seg2      segment
words:    dw      100 dup(?)
seg2      ends

seg3      segment

mirror    proc    far

                %pushr    (bp,cx,ax)
                %pushr    (di,si,f)

                mov     bp,sp
                mov     cx,word ptr [bp+16] ; size
                mov     si, word ptr [bp+18] ; str1
                mov     di, word ptr [bp+20] ; str2

next:       cld
            lodsw
            std
            stosw
            loop    next

                %popr     (f,si,di)
                %popr     (ax,cx,bp)

                ret     6

mirror      endp

seg3      ends
    
```

7

(c) Hamid Sarbazi-Azad
Computer Structure & Language, Lecture #7: Sample programs
8

Example 4: Write a program for mirroring a string using inter-segment procedure call. (cont.)

```

seg4      segment

start:     assume    cs:seg4,ds:seg1, es:seg1,ss:seg2
            mov     ax,seg1
            mov     ds,ax
            mov     es,ax
            mov     ax,seg2
            mov     ss,ax
            lea     sp,words+200

            mov     ax, offset str2+198
            mov     bx, offset str1
            mov     cx,100
            %pushr   (ax,bx,cx)

            call    far ptr mirror

            mov     ax,4c00h ; return to OS
            int     21h

seg4      ends

end       start
    
```

8

(c) Hamid Sarbazi-Azad
Computer Structure & Language, Lecture #7: Sample programs
9

Example 5: Write a code for moving string1 to string2 using and without using string instructions.

; Without string instructions	; With string instructions
<pre> .....       mov     si, offset string1       mov     di, offset string2       mov     cx, length string1 move:  mov     al,[si]       mov     [di],al       inc     si       inc     di       loop    move ..... </pre>	<pre> .....       mov     ax,ds       mov     es,ax       mov     si, offset string1       mov     di, offset string2       mov     cx, length string1       cld       rep     movs string1,string2 ..... </pre>

9

(c) Hamid Sarbazi-Azad
Computer Structure & Language, Lecture #7: Sample programs
10

Example 6: Write a program to add two 20-byte packed BCD numbers.

```

dataseg      segment
BCD1: db     20 dup (?)
BCD2: db     20 dup (?)
dataseg ends

codeseg segment
      assume cs: codeseg, ds: dataseg;
start: mov     ax,dataseg
      mov     ds,ax
      mov     bx,0
      mov     cx,20
      cld
      pushf
nextdigit:
      popf
      mov     al,BCD1[bx]
      adc     al,BCD2[bx]
      daa
      mov     BCD1[bx],al
      pushf
      inc     bx
      loop    nextdigit
      mov     ax,4c00h
      int     21h
      codeseg ends
      end     start

```

10

(c) Hamid Sarbazi-Azad		Computer Structure & Language, Lecture #7: Sample programs		11
Example 7: Write a program to multiply two 2-digit unpacked BCD numbers.				
mov	al,a			$a_1a_0 \times$
mul	b			$b_1b_0$
aam				-----
mov	word ptr c0, ax			$c_{02} \ c_{01} \ c_{00} \ +$
mov	al,a+1			$c_{12} \ c_{11} \ c_{10}$
mul	b			-----
aam				$c_3 \ c_2 \ c_1 \ c_0$
add	al,c0+1	mov	al,c0	
aaa		mov	c,al	
mov	word ptr c0+1,ax	mov	al,c0+1	
mov	al,a	add	al,c1	
mul	b+1	aaa		
aam		mov	c+1,al	
mov	word ptr c1,ax	mov	al,c0+2	
mov	al,a+1	adc	al,c1+1	
mul	b+1	aaa		
aam		mov	c+2,al	
add	al,c1+1	mov	al,0	
aaa		adc	al,c1+2	
mov	word ptr c1+1,ax	aaa		
		mov	c+3,al
